Allowable Subject Matter

1. Claims 1-22 and 26-30 allowed.

Reason for Allowance

2. The following is an examiner's statement of reasons for allowance:

The prior art of record does not teach the following:

In regards to claim 1 the prior art does not teach enqueue attributes configured to control a depth of the queue; and dequeue attributes configured to control scheduling of the queue, dequeue attributes comprising minimum bandwidth, maximum bandwidth, excess bandwidth, and priority, wherein each of plurality of queues has one or more of dequeue attributes defined; wherein plurality of queues define a queue hierarchy, each layer of queue hierarchy configured to support one or more priority queues and comprising one or more of queues configured for minimum bandwidth attribute and one or more of queues configured for excess bandwidth attribute;-and wherein a first of plurality of queues comprises a propagated attribute that propagates through hierarchy from first queue to a root queue, wherein propagated attribute applies to first queue and parent queues of first queue with respect to traffic associated with first queue, priority propagated attribute comprising a priority propagation attribute which specifies whether or not priority service at a queue is propagated through a hierarchy of the queue; and wherein a burst tolerance parameter is associated with a stream enabled with priority propagation, the burst tolerance parameter provided for each layer of hierarchy .through which priority behavior propagates.

In regards to claim 21 the prior art does not teach applying scheduling policies to traffic streams at one or more queues, scheduling policies comprising minimum bandwidth, maximum bandwidth, excess bandwidth, and priority, wherein traffic up to a specified bandwidth is defined as priority traffic; wherein each of layers is configured to support one or more priority queues and comprises one or more of queues configured for minimum bandwidth scheduling policy and one or more of queues configured for excess bandwidth scheduling policy; and wherein a first of plurality of queues comprises a propagated attribute that propagates through hierarchy from first queue to a root queue, wherein propagated attribute applies to first queue and parent queues of first queue with respect to traffic associated with first queue, priority propagated attribute comprising a priority propagation attribute which specifies whether or not priority service at a queue is propagated through a hierarchy of the queue; and wherein a burst tolerance parameter is associated with a stream enabled with priority propagation, the burst tolerance parameter provided for each layer of hierarchy through which priority behavior propagates.

In regards to claim 29 the prior art does not teach code that applies scheduling policies to traffic streams at one or more queues, scheduling policies comprising minimum bandwidth, maximum bandwidth, excess bandwidth, and priority, wherein traffic up to a specified bandwidth is defined as priority traffic; wherein plurality of queues define a queue hierarchy, each layer of queue hierarchy configured to support one or more priority queues and comprising one or more of queues configured for minimum bandwidth attribute and one or more of queues configured for excess

bandwidth attribute; and wherein a first of plurality of queues comprises a propagated attribute that propagates through hierarchy from first queue to a root queue, wherein propagated attribute applies to first queue and parent queues of first queue with respect to traffic associated with first queue, priority propagated attribute comprising a priority propagation attribute which specifies whether or not priority service at a queue is propagated through a hierarchy of the queue; and wherein a burst tolerance parameter is associated with a stream enabled with priority propagation, the burst tolerance parameter indicating how much the stream is permitted to burst beyond a rate constraint of an ancestral node before the stream becomes constrained by the rate.

In regards to claim 30 the prior art does not teach means for applying scheduling policies to traffic streams at one or more queues, scheduling policies comprising minimum bandwidth, maximum bandwidth, excess bandwidth, and priority, wherein traffic up to a specified bandwidth is defined as priority traffic; wherein plurality of queues define a queue hierarchy, each layer of queue hierarchy configured to support one or more priority queues and comprises one or more of queues configured for minimum bandwidth attribute and one or more of queues configured for excess bandwidth attribute; and wherein a first of plurality of queues comprises a propagated attribute that propagates through hierarchy from first queue to a root queue, wherein propagated attribute applies to first queue and parent queues of first queue with respect to traffic associated with first queue, priority propagated attribute comprising a priority propagation attribute which specifies whether or not priority service at a queue

is propagated through a hierarchy of the queue; and wherein a burst tolerance parameter is associated with a stream enabled with priority propagation, the burst tolerance parameter indicating how much the stream is permitted to burst beyond a rate constraint of an ancestral node before the stream becomes constrained by the rate.

The prior art alone or in combination fails to jointly suggest or teach the claimed combination of features as taught by the instant application. Therefore claims 1-22 and 26-30 are to be deemed allowable over prior art.
